

OPTICROP: SMART AGRICULTURAL PRODUCTION OPTIMIZATION ENGINE

PROBLEM-SOLUTION FIT ANALYSIS

1. Aligning User Pain Points with OptiCrop Features

The following analysis illustrates how OptiCrop's modules address specific agricultural challenges:

- Challenge: Crop Mismatch. Farmers often choose crops that do not align with soil properties, leading to low yields. OptiCrop Solution: The Crop Recommendation Classifier evaluates soil and climate parameters to recommend the most compatible crop.
- Challenge: Excess Fertilizer Costs. Over-application of fertilizer reduces profits and damages soil health. OptiCrop Solution: The NPK Vitality Prescription Engine calculates nutrient imbalances and recommends targeted corrections.
- Challenge: Financial Uncertainty. Farmers face uncertainty regarding crop yields. OptiCrop Solution: The Crop Yield Forecast module uses seasonal, regional, and soil variables to estimate expected yield.
- Challenge: Soil Diagnostics. Farmers lack resources for deep soil analysis. OptiCrop Solution: K-Means Clustering groups soil inputs into diagnostic categories, providing simple insights into soil properties.
